

■ ■ CYBERSECURITY NEWBIE JOURNEY LOG

Student Profile: Abdoulaye Sidibe (adamsy) | **Lab Platform:** HP Z440 Workstation (Intel Xeon, 64GB RAM, 512GB SSD)

■ SESSION 1: Physical Hardware & Setup Triage

Topic / Skill Mastered	Technical Definition & Real-world Application
SATA SSD Installation	Physically mounting and securing internal flash storage onto system rails for high-speed read/write performance.
Active Video Conversion	Deploying cables with built-in hardware microchips to actively translate video signal formats for workstation-grade graphics cards (Matrox C680).

■ SESSION 2: Enterprise Bypass & Infrastructure Injections

1. Windows Autopilot / OOBE Network Bypassing

Refurbished enterprise motherboards retain cloud registration identity hashes. Forcing an offline profile deployment breaks the remote server sync link:

```
OOBE\BYPASSNRO
```

2. Command Line Administrator Provisioning

Injecting clean localized profiles straight into local security group databases to secure root desktop access:

```
net user adamsy /add
net localgroup administrators adamsy /add
```

■ SESSION 3: Network Footprinting & Defensive Architecture

1. Network Footprinting & Reconnaissance (Nmap)

Utilizing Network Mapper engines to extract remote system fingerprints, port states, and active operating systems safely on authorized targets:

```
sudo nmap -v -A scanme.nmap.org
```

2. Defensive Firewalls & Default Deny Policies (UFW)

Enforcing network sandboxing boundaries. Building policies that allow vital outbound updates but proactively drop unwanted entry probes, with specific rules to permit service ports:

```
sudo apt update && sudo apt install ufw -y
sudo ufw default allow outgoing
```

```
sudo ufw default deny incoming  
sudo ufw allow 80/tcp  
sudo ufw enable
```
